Summary of Severe Weather Events on Population Health and Economy in the U.S.

qingcheng Thursday, August 21, 2014

Couresra-[Reproducible Research][repdata-005][Peer Assessment 2]

A. Synopsis

In this data analysis document, we will consider two questions.

- Which types of severe weather events are most harmful with respect to **population health** across the United States?
- Which types of events have the greatest **economic consequences**?

The data we used come from the U.S. National Oceanic and Atmospheric Administration's (NOAA) storm database. This database tracks characteristics of major storms and weather events in the United States, including when and where they occur, as well as estimates of any fatalities, injuries, and property damage.

The data come in the form of a comma-separated-value file compressed via the bzip2 algorithm to reduce its size. The data can be downloaded from the course web site:

• Storm Data

There is also two documentation of the database available:

- National Weather Service Storm Data Documentation
- National Climatic Data Center Storm Events FAQ

The events in the database start in the year 1950 and end in November 2011. In the earlier years of the database there are generally fewer events recorded, most likely due to a lack of good records. More recent years should be considered more complete.

From the analysis results, we can see that **tornado** is the most harmful with respect to **population health**, and **flood** and **drought** have the greatest economic consequences.

B. Data Processing

B.1. Locale and environment

```
Sys.setlocale('LC_ALL', 'English')
```

[1] "LC COLLATE=English United States.1252; LC CTYPE=English United States.1252; LC MONETARY=English United States.1252; LC

sessionInfo()

```
## R version 3.1.1 (2014-07-10)
## Platform: i386-w64-mingw32/i386 (32-bit)
##
## locale:
## [1] LC_COLLATE=English_United States.1252
## [2] LC_CTYPE=English_United States.1252
## [3] LC_MONETARY=English_United States.1252
## [4] LC_NUMERIC=C
## [5] LC_TIME=English_United States.1252
## attached base packages:
## [1] stats
                graphics grDevices utils
                                              datasets methods
                                                                  base
##
## loaded via a namespace (and not attached):
                                                         htmltools 0.2.4
## [1] digest 0.6.4
                    evaluate 0.5.5
                                       formatR 0.10
## [5] knitr_1.6
                       rmarkdown_0.2.49 stringr_0.6.2
                                                         tools_3.1.1
## [9] yaml_2.1.13
```

B.2. Download and read the dataset

```
DataUrl<-"http://d396qusza40orc.cloudfront.net/repdata/data/StormData.csv.bz2"
filename = "StormData.csv.bz2"
download.file(DataUrl, destfile=filename)
dateDownloaded <- date()</pre>
dateDownloaded
## [1] "Fri Aug 22 16:20:17 2014"
stormData <- read.csv(bzfile(filename))</pre>
```

B.3. Cleaning the dataset

The size of the raw data loaded is quite big:

```
print(object.size(stormData), units = "MB")
```

397.8 Mb

'data.frame':

So we need to subset the data selecting only columns relevant to the analysis. First to see the summary of the raw data:

```
str(stormData)
```

```
902297 obs. of 37 variables:
## $ STATE_ : num 1 1 1 1 1 1 1 1 1 1 ...
```

```
$ BGN_DATE : Factor w/ 16335 levels "1/1/1966 0:00:00",...: 6523 6523 4242 11116 2224 2224 2260 383

## $ REMARKS
## $ REFNUM
               : num 1 2 3 4 5 6 7 8 9 10 ...
```

We can see that there are 902297 obsevations of 37 variables in the raw data. Only 8 variables relevant to this analysis, so we subset these variables in new data frame data:

We begin by creating a new variable *date* in the *data* by coercing the "BGN_DATE" variable into a Date format variable.

```
data$date <- as.Date(data$bgn_date, format = "%m/%d/%Y")
mindate <- min(data$date)
maxdate <- max(data$date)</pre>
```

Therefore, the data was collected from 1950-01-03 to 2011-11-30.

To study which type of weather events are most harmful with respect to **population health**, we can take a look at the number of **fatalities** and **injuries** caused by different types of weather events.

For question which type of weather events have the greatest **economic consequences**, we will compare the **property damage** and **crop damage** caused by different types of weather events. As mentioned in section 2.7 of National Weather Service Storm Data Documentation, we need to convert the values of the columns PROPDMG and CROPDMG to unified number in dollars units, with the information in:

- PROPDMGEXP: magnitude of the number value of property damage.
- PROPDMGEXP: magnitude of the number value of crop damage.

Take a look at the PROPDMGEXP and PROPDMGEXP:

```
#all event types to upper case and refactored
data$evtype <- factor(toupper(data$evtype))
# all exponents defining unit of measurement of costs to upper case and refactored
data$propdmgexp <- factor(toupper(data$propdmgexp))
data$cropdmgexp <- factor(toupper(data$cropdmgexp))
levels(data$cropdmgexp)
## [1] "" "?" "0" "2" "B" "K" "M"</pre>
```

```
levels(data$propdmgexp)
```

```
## [1] "" "-" "?" "+" "0" "1" "2" "3" "4" "5" "6" "7" "8" "B" "H" "K" "M"
```

We just keep those records which have one of these values in these fields:

- "" and "0": for one
- "H": for hundreds
- "K": for thousands
- "M": for millions
- "B": for billions

```
## [1] 902191
```

Compare with the origin number of obsevations 902297, we know that the vast majority of records (902191) have a meaningful exponent. Then we convert the damage values to number in dollars units.

```
colnames(validExpo) <- c("validexp", "propdmgmultiplier")
data <- merge(data, validExpo, by.x = "propdmgexp", by.y = "validexp")
data$propdmg <- (data$propdmg * data$propdmgmultiplier)

colnames(validExpo) <- c("validexp", "cropdmgmultiplier")
data <- merge(data, validExpo, by.x = "cropdmgexp", by.y = "validexp")
data$cropdmg <- (data$cropdmg * data$cropdmgmultiplier)</pre>
```

B.4. The top 10 serious types of events on Population Health

After above data cleaning work, we will sort the data first then only take the 10 first most serious types of weather events to visualize and analyze.

B.5. The top 10 serious types of events on Economic Consequences

Like the previous section, we only select top 10 serious types of events to visualize and analyze.

C. Results

After data processing above we can visualize our results.
